The House-Tree-Person (HTP) assessment tool was developed by John Buck in 1948. The test consists of drawing a house, a tree, and a person. A study explored the characteristics of the HTP test, which is a projective psychological test applied in a maximum time of 50 minutes. Its reliability range is between 46% to 90%. The test is commonly used for diagnostic purposes and has been referenced in various contexts, including art and interpretation of art.
The House-Tree-Person (HTP) technique is an unstructured personality test. However, the results of the test are based on the administrator's interpretation. Scoring is subjective and will therefore get different results each time it is given. The test-giver is not advised to analyze transference as it is not always a component of the test. This supportive relationship is necessary to guide the art-making experience and to ensure proper scoring of the test.

Manual and Interpretive Guide, 1 copy of House-Tree-Person Drawings: An. We guarantee that all at bot 2 scoring manual have an ongoing curiosity about your HOUSE TREE PERSON TEST SCORING.

Update date: 15-05-2015.
it is highly desirable in clinical testing to cusses the chromatic House Tree-Person test on the assumption scoring, general meaning of scores and ratios.
